(I)

(57) Abstract: The invention relates to novel antibacterial compounds  
of formula (I).(57) Zusammenfassung: Die vorliegende Anmeldung beschreibt neu-  
artige antibakterielle Verbindungen der Formel (I).

### Novel compounds having anti-bacterial activity

Resistance to the antibiotics used currently has increased appreciably in many countries of the world in recent years and in some cases has assumed alarming proportions. The main problem is that those pathogens exhibit not just a single resistance but, as a rule, multiple resistance. This is true especially of some gram-positive pathogen groups, such as staphylococci, pneumococci and enterococci (S. Ewig et al.; Antibiotika-Resistenz bei Erregern ambulant erworbener Atemwegsinfektionen (Antibiotic resistance in pathogens of outpatient-acquired respiratory tract infections); Chemother. J. 2002, 11, 12-26; F. Tenover; Development and spread of bacterial resistance to antimicrobial agents: an overview; Clin. Infect. Dis. 2001 Sep 15, 33 Suppl. 3, 108-115)

A long-feared development has recently occurred: In the USA, the first strain of *Staphylococcus aureus* has been described that is not only resistant to methicillin but also highly resistant to vancomycin (Centers for Disease Control and Prevention; *Staphylococcus aureus* resistant to vancomycin - United States, 2002; MMWR 2002, 51, 565-567). In addition to hygiene measures in hospitals, therefore, increased efforts are also required to find new antibiotics that as far as possible have a novel structure and a novel mechanism of action so as to be effective against those problem bacteria.

The present invention describes new kinds of compounds having anti-bacterial activity.

The present invention relates to compounds of the general formula (I):

Such therapeutically useful agents may be administered, for example, by one of the following routes: orally, for example in the form of dragées, coated tablets, pills, semi-solid substances, soft or hard capsules, solutions, emulsions or suspensions; parenterally, for example in the form of an injectable solution; rectally in the form of suppositories; by inhalation, for example in the form of a powder formulation or spray, transdermally or intranasally. For the preparation of such tablets, pills, semi-solid substances, coated tablets, dragées and hard gelatin capsules, the therapeutically usable product can

be mixed with pharmacologically inert, inorganic or organic pharmaceutical carrier substances, for example with lactose, sucrose, glucose, gelatin, malt, silica gel, starch or derivatives thereof, talcum, stearic acid or salts thereof, skimmed milk powder and the like. For the preparation of soft capsules, pharmaceutical carrier substances such as, for example, vegetable oils, petroleum, animal or synthetic oils, wax, fat and polyols can be used. For the preparation of liquid solutions and syrups, pharmaceutical carrier substances such as, for example, water, alcohols, aqueous saline solution, aqueous dextrose, polyols, glycerol, vegetable oils, petroleum and animal or synthetic oils can be used. For suppositories, pharmaceutical carrier substances such as, for example, vegetable oils, petroleum, animal or synthetic oils, wax, fat and polyols can be used. For aerosol formulations, compressed gases that are suitable for the purpose can be used, such as, for example, oxygen, nitrogen and carbon dioxide. The pharmaceutically acceptable agents may also comprise additives for preserving and stabilising, emulsifiers, sweeteners, flavourings, salts for altering the osmotic pressure, buffers, encapsulation additives and anti-oxidants.

Combinations with other therapeutic agents may comprise other antimicrobial and anti-fungal active ingredients.

For the prevention and/or treatment of bacterial infections, the dose of the biologically active compound according to the invention can vary within wide limits and can be adjusted to individual requirements. Generally, a dose of from 10 mg to 4000 mg per day is suitable, a

preferred dose being from 50 to 3000 mg per day. In suitable cases, the dose may also be below or above the stated values. The daily dose can be administered as a single dose or in a plurality of doses. A typical individual dose contains approximately 50 mg, 100 mg, 250 mg, 500 mg, 1 g or 2 g of the active ingredient.

Example 1: 2-((3RS)-{[(2,3-Dihydro-benzo[1,4]dioxin-6-yl-methyl)amino]methyl}piperidin-1-yl)-(1RS)-(6-methoxy-quinolin-4-yl)ethanol.

15 1.a) Benzyl (3RS)-azidomethylpiperidine-1-carbamate:

At 0°C, triethylamine (5.6 ml, 40.1 mmol) and then methanesulphonyl chloride (2 ml, 25.7 mmol) were added to a solution of benzyl 3-hydroxymethylpiperidine-1-carbamate (5 g, 20.05 mmol) in dichloromethane (100 ml). After the solution had been stirred for 20 min., the reaction mixture was cooled to -60°C and a solution of benzyl 4-oxopiperidine-1-carbamate (2.33 g, 10 mmol) in diethyl ether (10 ml) was added. The reaction mixture was heated to room temperature in the course of 30 minutes and water (40 ml) was added. The two phases were separated and the aqueous phase was extracted twice using 50 ml of ethyl

acetate each time. The combined organic phases were washed with 20 ml of saturated sodium chloride solution, dried over  $\text{MgSO}_4$ , filtered and concentrated to dryness by rotary evaporation. The residue was purified by column chromatography on silica gel (EtOAc). The resulting oil was dissolved in DMF (45 ml), and sodium azide (2.6 g, 40 mmol) was added. The reaction mixture was further stirred for 3 hours at  $80^\circ\text{C}$  and then diluted with water (100 ml) and ethyl acetate (200 ml). The two phases were separated and the aqueous phase was extracted twice using 50 ml of ethyl acetate each time. The combined organic phases were washed with 20 ml of saturated sodium chloride solution, dried over  $\text{MgSO}_4$ , filtered and concentrated to dryness by rotary evaporation. The residue was purified by column chromatography on silica gel (hexane/EtOAc 1/1).

 5 (0.172 g, 1.15 mmol) were added to a solution of 2-(2-aminomethyl-morpholin-4-yl)-1-(6-methoxy-quinolin-4-yl)-ethanol (0.365 g, 1.15 mmol) in DCM (10.5 ml) and methanol (3.5 ml). The mixture was stirred overnight at room temperature before sodium borohydride (0.112 g, 2.9 mmol)  
 10 was added. The reaction mixture was stirred at room temperature for a further 2 hours, filtered over Hydromatrix (wetted with NaHCO<sub>3</sub>) and concentrated. The residue was purified by chromatography on silica gel (DCM:MeOH 9:1+ 1% NH<sub>4</sub>OH).

15 Yield: (0.261 g, 0.57 mmol, 50%) Oil.
